t.me/ggStrider · Remote (occasional travel with covered relocation/travel)

3+ years building in Unity — one shipped commercial title on Steam, a game-jam release, and a long list of solo projects, including a multiplayer tank game with hand-rolled netcode (prediction, reconciliation, lag compensation). On **Armageddonica** I split my time between gameplay/bugfixing and editor tooling for artists and designers, plus doing a lot of the unglamorous cross-team troubleshooting nobody assigns but somebody has to do. I pitch ideas when I have them and I'm usually right about whether a mechanic will hold up after a month of development.

PROFESSIONAL EXPERIENCE

Gameplay Programmer — Thrones of Ashes

Oct 2025 – Jul 2026 · Remote

Unreleased RPG — lore-driven world, full gear system (armor pieces with individual stats and enchantments, weapons with distinct effects), varied enemies and game modes. Team started at 8: 3 programmers, 3 artists, 2 game designers, a community manager.

- Refactored a sizable legacy codebase while shipping new features across it — the gear and stats system, weapon effects, enemy variety, and game modes.
- Designed and built the game's cutscene system, then built an editor tool on top of it so anyone on the team could put a cutscene together without touching code.
- Worked closely with the animator to get combat and cutscene animations wired up correctly, and implemented a steady stream of assets coming in from the art team.
- The programming team shrank from 3 to 2 to just me over the project's lifetime — I ended up carrying the engineering side solo for the last stretch.

Gameplay & Tools Programmer — neoTemplar

Feb 2025 – Sep 2025 · Remote

*Shipped **Armageddonica** — hybrid hack-and-slash ARPG + RTS, direct hero combat combined with large-scale autonomous army command. Team of 11: 3 programmers, 2 artists, a UI artist, a level designer, 2 game designers, a community manager, and the founder.*
store.steampowered.com/app/3166960/Armageddonica

- Owned day-to-day gameplay feature work and bug fixing on a live, shipping codebase — small fixes, bigger features, whatever came up; implemented UI from Figma handoffs.
- Turned our prefab-scattering tool into something the art team actually reached for daily: smarter placement logic so props stopped clumping together, a UI cut down to a few preset buttons, and a lighter version just for level designers. Also built a stack of small utilities around it — a screenshot tool, a null-prefab cleanup, a batch prefab replacer — nothing flashy, just things that saved people a few minutes every day.
- Replaced multi-step manual setups with one-click editor tools — cloud shadows, minimap generation, terrain grass presets — so designers stopped needing a walkthrough every time they wanted one.
- Ended up as the unofficial fixer for artists' technical problems — broken Git merges, missing shadows, terrain you couldn't click on. Happened often enough that people just started coming to me by default instead of opening a ticket.
- Noticed the game had no loading screen — scene changes just looked frozen — so I built one (random art/tips, fade transitions), then followed it up with a UI polish pass: hover states, press feedback, sound cues.
- Wrote a tool that batch-converts old Text components to TextMeshPro without losing formatting, and moved a lot of tunable gameplay values into ScriptableObjects so designers could tweak numbers themselves.
- Two weeks into the project, before I knew the whole game, a designer asked me to play through a chapter and report where it got confusing. I recorded myself doing it instead of writing notes — turned out to land a lot better with the team than a report would have.

SELECTED PERSONAL PROJECTS

Multiplayer Tank Game Work in progress

Competitive multiplayer shooter with custom netcode built on Mirror: client-side prediction, movement reconciliation, and lag compensation. Modular tank customization (hull / turret / commander) with unique turret ability kits (charge-based buffs, flamethrower, grenade launcher, beam-damage turret, AoE splash). Config-driven game modes (DM / TDM / CTF) implemented as ScriptableObjects wired through Zenject bindings.

Hermit Night 1 & 2 Narrative horror — itch.io/hermit-night · hermit-night-2

Two-part atmospheric horror built solo end-to-end: custom cutscene sequencing system, dynamic lighting/particle work for storm effects, and radio/audio-driven narrative pacing.

Locked In Nonsense Comedic horror / exploration — itch.io/locked-in-nonsense

Patrol/chase AI, multi-quest structure, and a full custom item system — including an in-world playable video player object and camera-based room monitoring.

Interpressure Game jam — city builder — itch.io/interpressure

Built with a 4-person team (2 programmers) for a "Bubbles"-themed jam: resource-driven building system, session save/load, 2D cutscene, and an in-game illustrated tutorial.

shootemup-64 Rhythm-based arcade shooter — github.com/ggStrider/shootemup-64

Music-synced color-matching shooter extended with a purchasable power-up economy (piercing shots, slow/haste zones) and post-run stats.

AnExprmnt Comedic horror

Built solo, purely to make friends laugh. Patrol/chase AI with periodic aggro, a 3-item ability kit driving a small risk/reward combat loop, and a "smash-button" interaction mechanic.

dhCDNAME Narrative horror itch.io/dhcdname

First shipped project: mini-quest/objective tracking, interactable notes, and event-driven lighting/audio triggers for a thunderstorm sequence.

slowmo kenr Bullet-hell arena

Built around a time-slow mechanic with camera-zoom feedback — waves of attacks (homing rockets, sinusoidal bullet patterns, lasers, timed bomb bursts) that the slow-mo button turns into a puzzle instead of a reflex check.

twbG Gravity-shifting movement prototype

Player redirects their own gravity on the fly and flies toward whichever direction they pick, with interactive objects and collectibles scattered through the level.

Dare to Share Card-based party game, Android

A prompt-card app for friend groups — pick a category or mix them all, and a full undo/redo history stack lets you step back and forth through the deck.

TECHNICAL SKILLS

Engine: Unity (3+ years)
Languages: C# (primary), C++, Java (basic)
Core frameworks: Zenject (incl. SignalBus), DOTween / PrimeTween, UniTask, Odin Inspector
Systems: Dialogue System & Quest System (Pixel Crushers), Cinemachine, Timeline, Input System
Multiplayer: Client-side prediction, movement reconciliation, lag compensation (custom netcode)
Editor tooling: Custom editor windows/inspectors, ScriptableObject-driven workflows, artist/LD-facing utilities
Other: NaughtyAttributes, Assembly Definitions, Git, Linux, debugging (breakpoints/step-through)
What about AI: If project require to use it - I can use it. If project require to not use it - I can do my job without AI freely.

ADDITIONAL EXPERIENCE

Modding & scripting

- Custom HLDS/ReHLDS server plugins (AMX Mod X / Pawn) — built a custom Jailbreak game mode with original menus and events
- Minecraft mod development
- Arduino programming (hobby electronics)

Research

- Published in-depth technical research: "How to Make 2D Platformer Movement That Feels Good" — a from-scratch breakdown of acceleration curves, jump physics, coyote time, input buffering, and corner correction, with working code (Medium)

EDUCATION

State University of Intelligent Technologies and Telecommunications (Odesa) 2024 - 2028 (expected)

Eötvös Loránd University (ELTE), Budapest — Exchange Program 2026 - 2027

LANGUAGES

Ukrainian — Native **English** — C1 **Russian** — Fluent
